New Waterex Website

Over the last few months Waterex has been transitioning to a new website. On this new site we have a lot more information than previously provided on what we offer and where we have deployed our products.

We invite you to have a look at the new site and see if your project is featured or if there is something that you need that maybe you were not aware that we offered.

Excellence in Solids Liquid Separation Worldwide

Delivering DAFT Plant for Rockingham WWTP

Waterex is in the process of completing the installation of our first Municipal Dissolved Air Flotation (DAF) unit in Australia.

This is an exciting step for us as it takes us back to our roots in municipal water works in Africa whilst allowing us to bring new technology adapted from our industrial and mining flotation experience with micro air flotation systems there. This DAFT unit located in East Rockingham will serve as the main unit for flotation of bio-solids from waste water for the Water Corporation at that location.

This plant is designed to remove between 500 and 4,000ppm of waste from an average flow of 125 m³/hr of product liquor from the upstream process.

We look forward to continuing to work with all the parties involved as we near commissioning.

Waterex backs its flotation technologies with laboratory and pilot trial simulators.
